brandcompete

EnvCraft by brandcompete

Cloud environments in minutes. Governed from the first click.

Your data science teams want a notebook server today. Your IT has to keep clouds, costs and access under control. EnvCraft gives both sides what they need: self-service environments with your company's rules built in.

1

For data science teams

JupyterLab, VS Code, R, Superset or Spark — ready in minutes, datasets mounted, a terminal in the browser. Or just ask Mason.

2

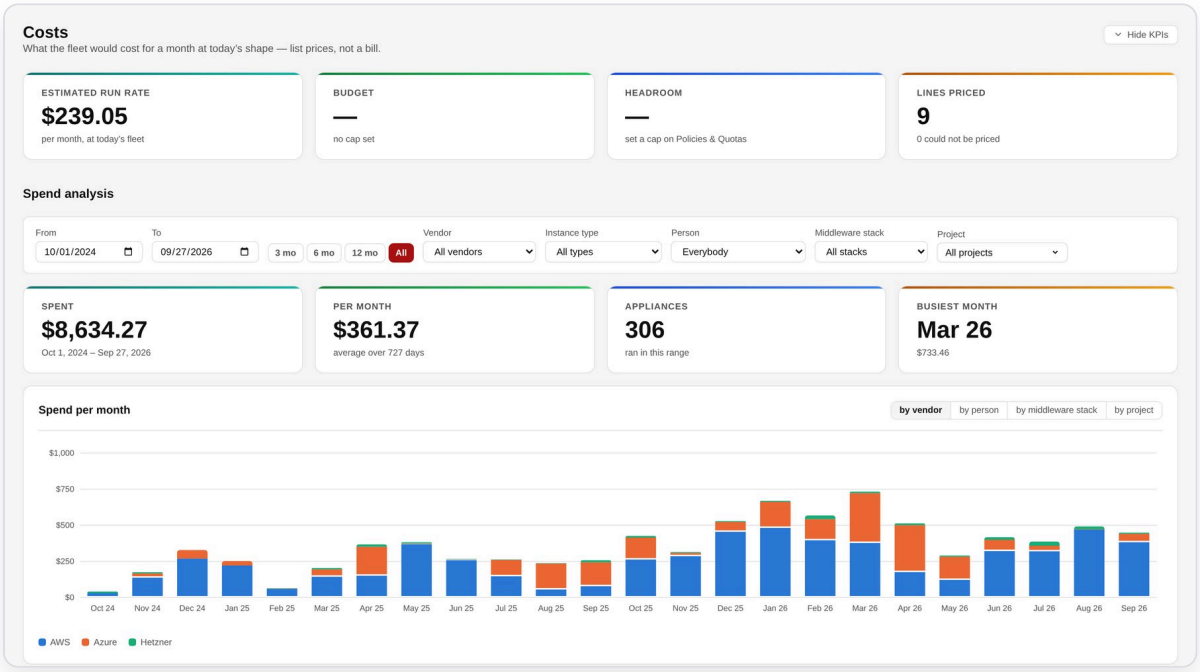

For IT & platform leads

Clouds, instance types, quotas and budgets checked before anything reaches a cloud. Projects, SSO, roles and a full audit trail.

3

For finance & controlling

The run rate of every environment, spend by vendor, person or project, budgets that warn or refuse — and machines that switch off at night.

Costs: run rate, budget and a spend analysis by vendor, person, software stack or project.

Clouds today: AWS • Microsoft Azure • Google Cloud • Hetzner **Next:** STACKIT • gridscale • on-premise

EnvCraft at a glance

Appliances
A cloud machine plus its software, from a four-step wizard on AWS, Azure, Google Cloud or Hetzner. Run it from one workbench, with a terminal in the browser.

Projects
Colleagues at Read, Write or Admin. Every appliance, dataset and data source belongs to a project — and so does its cost.

Deploy from a repository
Register a GitHub repository and get a web server already serving it. The token never reaches the machine.

Governance & security
Allowed clouds, credentials and instance types, quotas. Entra ID and Google SSO, custom roles, audit log, five-minute SSH certificates.

38 ready software stacks
Jupyter, R, ML, Superset, Airflow, PostgreSQL, SQL Server, Oracle, VS Code, Node, wikis and more — every licence in the Knowledgebase.

Data & transfers
Storage mounted into every appliance on every cloud. PostgreSQL, Redshift, SQL Server, Oracle, Databricks or open data, on a schedule.

Costs, budgets & schedules
Spend by vendor, person or project; budgets that warn or refuse; power schedules on AWS, Azure and Google Cloud.

Mason & MCP
An assistant that proposes an environment and builds it with your rights, never more. Anything that spends money or grants access waits for you.

How it works

Request — cloud, stack, size ▸ **Policy check** — clouds, quotas, budget ▸ **Build** — Terraform ▸ **Configure** — Ansible ▸ **Ready** — open & work

Why EnvCraft

- **Governance by construction** — compliance comes from templates and policies, not review after the fact
- **No lock-in** — plain Terraform and Ansible in your own cloud accounts
- **Licences in the open** — all listed in the Knowledgebase; open source except SQL Server Express, Oracle Free and the Netdata dashboard, free under their vendors' terms
- **Made in Germany** — designed, built and supported by brandcompete GmbH

Two ways to run it

Managed service
We operate EnvCraft for you — inside your infrastructure or cloud account.

On-premise licence
Your platform team runs it; brandcompete provides releases and support.

Companies that work with brandcompete

Serviceplan Group · Continental Tires · ContiTech · AUMOVIO · Schaeffler

Start with a pilot

One team, real projects, real guardrails — and a decision based on facts after a few weeks.
